# classification-assignment

November 24, 2024

# 1 Objective

The objective of this assessment is to evaluate the understanding and ability to apply supervised learning techniques to a real-world dataset.

## 1.1 Data description

dataset: Breast cancer source: sklearn Library

## 1.2 Importing libraries

```
[199]: import numpy as np
       import pandas as pd
       import matplotlib.pyplot as plt
       import seaborn as sns
       from sklearn.preprocessing import LabelEncoder, OneHotEncoder
       from sklearn.feature_selection import VarianceThreshold
       from sklearn.preprocessing import StandardScaler, MinMaxScaler
       from sklearn.model_selection import train_test_split
       from sklearn.linear_model import LogisticRegression
       from sklearn.tree import DecisionTreeClassifier
       from sklearn.ensemble import RandomForestClassifier
       from sklearn.svm import SVC
       from sklearn.neighbors import KNeighborsClassifier
       from sklearn.metrics import accuracy_score, classification_report, __
        ⇔confusion matrix
       from sklearn.model_selection import GridSearchCV
       import joblib
       import warnings
       warnings.filterwarnings("ignore")
```

#### 1.3 importing Dataset

```
[13]: from sklearn.datasets import load_breast_cancer
     data = load_breast_cancer()
     data
[13]: {'data': array([[1.799e+01, 1.038e+01, 1.228e+02, ..., 2.654e-01, 4.601e-01,
             1.189e-01],
             [2.057e+01, 1.777e+01, 1.329e+02, ..., 1.860e-01, 2.750e-01,
             8.902e-02],
             [1.969e+01, 2.125e+01, 1.300e+02, ..., 2.430e-01, 3.613e-01,
             8.758e-02],
             [1.660e+01, 2.808e+01, 1.083e+02, ..., 1.418e-01, 2.218e-01,
             7.820e-02],

 'DESCR': '.. breast_cancer_dataset:\n\nBreast_cancer_wisconsin (diagnostic)
dataset\n-----\n\n**Data Set
Characteristics:**\n\n:Number of Instances: 569\n\n:Number of Attributes: 30
numeric, predictive attributes and the class\n\n:Attribute Information:\n
radius (mean of distances from center to points on the perimeter)\n
                                                                - texture
                                                        - area\n
(standard deviation of gray-scale values)\n - perimeter\n
smoothness (local variation in radius lengths)\n
                                             - compactness (perimeter^2 /
area - 1.0)\n - concavity (severity of concave portions of the contour)\n
- concave points (number of concave portions of the contour)\n - symmetry\n
- fractal dimension ("coastline approximation" - 1)\n\n
                                                    The mean, standard
error, and "worst" or largest (mean of the three\n worst/largest values) of
these features were computed for each image,\n resulting in 30 features. For
instance, field 0 is Mean Radius, field\n
                                       10 is Radius SE, field 20 is Worst
                                 - WDBC-Malignant\n

Benign\n\n:Creator: Dr. William H. Wolberg, W. Nick Street, Olvi L.
Mangasarian\n\n:Donor: Nick Street\n\n:Date: November, 1995\n\nThis is a copy of
UCI ML Breast Cancer Wisconsin (Diagnostic)
datasets.\nhttps://goo.gl/U2Uwz2\n\nFeatures are computed from a digitized image
of a fine needle\naspirate (FNA) of a breast mass. They
describe\ncharacteristics of the cell nuclei present in the image.\n\nSeparating
plane described above was obtained using\nMultisurface Method-Tree (MSM-T) [K.
P. Bennett, "Decision Tree\nConstruction Via Linear Programming." Proceedings of
```

```
the 4th\nMidwest Artificial Intelligence and Cognitive Science Society,\npp.
     97-101, 1992], a classification method which uses linear\nprogramming to
     construct a decision tree. Relevant features\nwere selected using an exhaustive
     search in the space of 1-4\nfeatures and 1-3 separating planes.\n\nThe actual
     linear program used to obtain the separating plane\nin the 3-dimensional space
     is that described in:\n[K. P. Bennett and O. L. Mangasarian: "Robust
     Linear\nProgramming Discrimination of Two Linearly Inseparable
     Sets",\nOptimization Methods and Software 1, 1992, 23-34].\n\nThis database is
     also available through the UW CS ftp server:\n\nftp ftp.cs.wisc.edu\ncd math-

#### 1.7 Preprocessing steps and explanation

- 1. Fetched basic details of the dataset with info(), describe(), shape and dtypes
- 2. Checked for duplicate values and null values. The data dont have any null/duplicated values
- 3. Added boxplot for every column to visualise if there is any outliers present
- 4. also added a single box plot chart combining every feature to compare the outliers
- 5. Used IQR method to find the outliers of all features
- 6. Used capping method further to fix the outliers
- 7. Target feature doesn't have any outliers so dropped it for outlier fixing
- 8. After Capping added box plot again to see the changes after outlier fixation
- 9. Checked for the skew value for every feature . skew was in a good range.
- 10. Drawn a histogram for every feature
- 11. Added a correlation heatmap to see the relationship
- 12. Added a scattershot for mean radius vs mean area

#### 1.8 Feature Selection

0

```
# Using correlation matrix

# Compute correlation matrix
corr_matrix = df1.corr().abs()

# Select upper triangle of correlation matrix
upper = corr_matrix.where(np.triu(np.ones(corr_matrix.shape), k=1).astype(bool))

# Find features with correlation > 0.9
to_drop = [column for column in upper.columns if any(upper[column] > 0.9)]

print(f"Features to drop due to high correlation: {to_drop}")

# Drop features
df1_reduced = df1.drop(columns=to_drop)
```

Features to drop due to high correlation: ['mean perimeter', 'mean area', 'mean concave points', 'perimeter error', 'area error', 'worst radius', 'worst texture', 'worst perimeter', 'worst area', 'worst concavity', 'worst concave points']

```

#### 1.11 Splitting data to train and test

#### 1.12 Building Models

```
models = {
    "Logistic Regression": LogisticRegression(max_iter=500),
    "Decision Tree": DecisionTreeClassifier(max_depth=5),
    "Random Forest": RandomForestClassifier(n_estimators=100),
    "SVM": SVC(kernel='linear', C=1),
    "k-NN": KNeighborsClassifier(n_neighbors=5)
}
```

#### 1.13 Logistic regression

Logistic Regression is a linear model that predicts probabilities using a logistic (sigmoid) function. It outputs probabilities for binary classification and assigns a label (e.g., cancerous or non-cancerous) based on a threshold (commonly 0.5). The decision boundary is linear in the feature space.

Why It's Suitable:

It is simple, interpretable, and performs well with linearly separable datasets. Breast cancer datasets often show clear patterns that logistic regression can model effectively. The coefficients provide insights into feature importance, which is valuable in medical analysis.

#### 1.14 Decision Tree Classifier

Decision Trees split the data into subsets based on feature values, creating branches until a decision (classification) is reached at a leaf node. The splits are based on criteria like Gini Impurity or Information Gain.

Why It's Suitable:

It handles both categorical and numerical features effectively. The tree structure is easy to visualize and interpret, making it suitable for explaining the classification process in medical scenarios. It captures complex relationships in the data, even if non-linear.

#### 1.15 Random Forest Classifier

Random Forest is an ensemble method that builds multiple decision trees during training and aggregates their outputs (via majority voting for classification). It introduces randomness by bootstrapping the data and selecting random subsets of features for splitting.

It improves accuracy by reducing overfitting, which can occur in individual decision trees. Robust to noisy data and outliers, making it suitable for datasets like breast cancer with varying feature distributions. It can rank feature importance, aiding in understanding the factors influencing predictions.

#### 1.16 SVC

SVM aims to find the hyperplane that best separates data points of different classes by maximizing the margin between them. It can use kernels (e.g., linear, RBF) to transform data into higher dimensions for better separability.

It works well in high-dimensional spaces like the breast cancer dataset, which has many features. Effective for datasets where classes are not easily separable in the original feature space. It's robust to overfitting when the number of features exceeds the number of samples.

#### 1.17 k-Nearest Neighbors (k-NN)

k-NN classifies a data point based on the majority class of its k nearest neighbors in the feature space. Distance metrics (e.g., Euclidean) are used to identify neighbors.

It is a simple, non-parametric algorithm that makes no assumptions about the underlying data distribution. Suitable for datasets where class distributions are clear and well-clustered. Effective when feature scaling (e.g., standardization) is applied, as it's sensitive to feature magnitudes.

```
[169]: # Train and evaluate each model
       results = {}
       for model_name, model in models.items():
           print(f"Training {model name}...")
